The issue you're describing—file parsing stalling at 1% despite successful uploads and chats, with MinIO logs showing `NoSuchKey` errors during what appears to be a "put" operation on the original file object—points to a bug in the file processing pipeline. This is common in older versions of RAGFlow (like your v0.12.0-slim), where the integration between the server, MinIO, and the parsing/embedding workflow can fail during object retrieval or re-upload steps after initial storage. The `Can't update token usage` errors in `database.log` are downstream effects, as embedding can't proceed without successful parsing.

The good news is that this has been addressed in subsequent releases through fixes to S3-compatible storage access (including dynamic per-knowledge-base buckets like your UUID-named one), parsing robustness, and error handling for object operations.

Recommended Solution: Upgrade to the Latest Version

Upgrade to v0.20.5-slim (the current stable release as of September 2025). This includes improvements to MinIO/S3 bucket handling (e.g., better role-based access and object operations) and parsing stability that resolve similar `NoSuchKey` stalls.

Upgrade Steps

1. **Backup Your Data** (critical to avoid loss):
   - Stop services: `docker compose down`.
   - Backup volumes (these persist your MinIO files, MySQL DB, ES indices, and Redis):

     text 收起 自动换行 复制

     ```
     docker volume ls | grep ragflow
     # For each volume (e.g., ragflow-minio), use: docker run --rm -v ragflow
     ```

   - Or use `docker compose down --volumes` temporarily if testing, but restore from backups.

2. **Update Your Setup**:

- Edit `docker/docker-compose.yml` (or your variant) to use the new image tag:

```text
services:
  ragflow-server:
    image: infiniflow/ragflow:v0.20.5-slim
```

  - Your MinIO image (RELEASE.2025-06-13T11-33-47Z) is compatible and recent— no change needed.
  - Ensure your `.env` file has consistent MinIO creds (default: `MINIO_USER=rag_flow`, `MINIO_PASSWORD=ragflow` —confirm yours match across services).

3. **Restart**:

```text
docker compose pull  # Fetch new images
docker compose up -d
```

   - Monitor logs: `docker compose logs -f ragflow-server` and `docker compose logs -f ragflow-minio`.
   - Wait for health checks (all containers should show "healthy").

4. **Post-Upgrade Verification**:
   - Re-upload a test file (e.g., your Snakefile.txt) to a knowledge base.
   - Monitor parsing progress in the UI—it should complete beyond 1%.
   - If still stuck, check MinIO console (http://localhost:9001, login with your MINIO_USER/PASSWORD) for the exact bucket (e.g., `cba431cf9ce411f0a251ae83944ff807`) and object (`Snakefile.txt`). Confirm the object exists and is readable. If not, there may be a .env mismatch—double-check `MINIO_ENDPOINT=minio:9000`, `MINIO_ACCESS_KEY`, and `MINIO_SECRET_KEY` in the server's env.

If Upgrade Doesn't Resolve (Rare)

- **Test MinIO Access Manually**: Exec into the server container (`docker exec -it ragflow-server bash`) and test with MinIO client (install via `apt update && apt install -y wget && wget https://dl.min.io/client/mc/release/linux-amd64/mc && chmod +x mc && ./mc alias set local http://minio:9000 $MINIO_ACCESS_KEY $MINIO_SECRET_KEY`). Then: `./mc ls local/cba431cf9ce411f0a251ae83944ff807` (replace with your bucket). If `NoSuchKey` here, it's a config issue.
- **Clear Stale Data**: Delete the problematic knowledge base/file in the UI, recreate, and retry.
- **Check ES/MySQL**: Run `docker compose logs ragflow-es-01` for index errors (e.g., missing `ragflow_*` indices)—recreate if needed via UI.
- Report to GitHub (infiniflow/ragflow/issues) with your logs, .env (redacted), and compose file for community help.

This should get you unblocked—let me know if you hit snags during upgrade!
